

# Scheduling a scenario

Make allows you to define when and how often an [activated](#) scenario executes.

1. Go to the [scenario detail page](#)
2. Open the **Schedule setting panel** under the **Options** tab
3. Click **Scheduling**

## Schedule setting panel

The schedule setting panel lets you adjust the running schedule of the scenario. By default, a scenario runs every 15 minutes, but within this panel, you can customize the run schedule and the interval.

## Run scenario

You can select the following schedule options:

- Immediately
- At regular intervals
- Once
- Every day
- Days of the week
- Days of the month
- Specified dates

When choosing any of these options, you may have to further define how often you want the run to occur. For example, if you select the *At regular intervals* option you must define the time interval (in minutes) between two consecutive scenario runs.

The minimal length of the interval depends on your [subscription plan](#).

The *Immediately* option is available only for some triggers. For more information on triggers, please see the [types of modules](#) help guide.

## Start and end date

To define the time range in which an activated scenario runs, check the **Show advanced settings** box and fill in the *Start* and *End* date.
